Link your PDF content to the Web

When you use [Adobe® Acrobat®](#) to add Web links to your PDF pages, you keep your pages clean and easy to read, while pointing viewers to related subjects. Learn how to link elements, and control the look and behavior of your links.

1. Define a link.

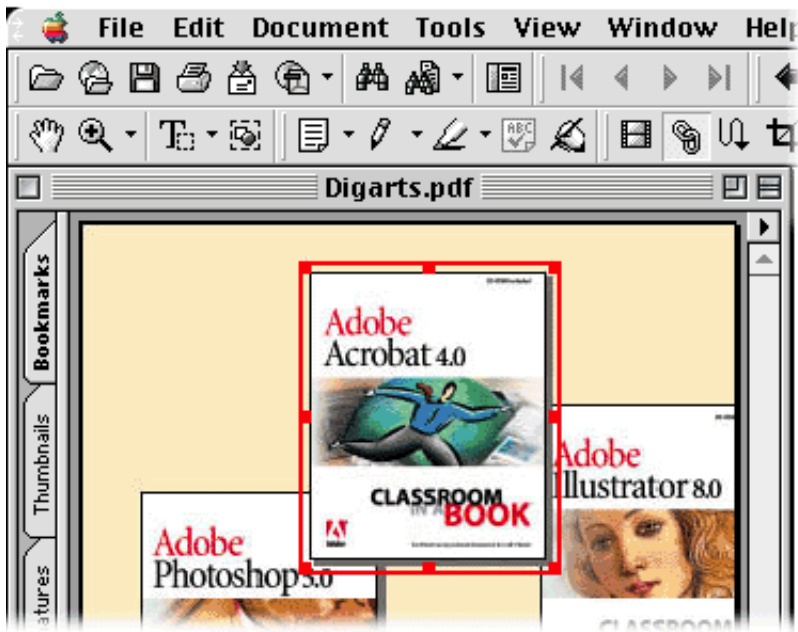

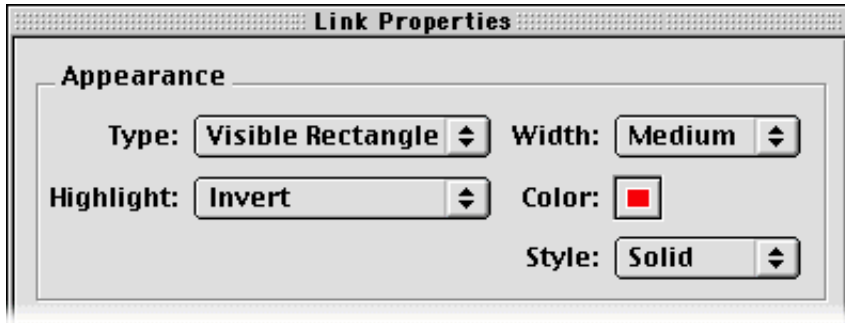

Select the link tool and drag to create a marquee around the element you want to use as a link. This opens the Link Properties dialog box. In this example, we selected the center image of the book for our link.

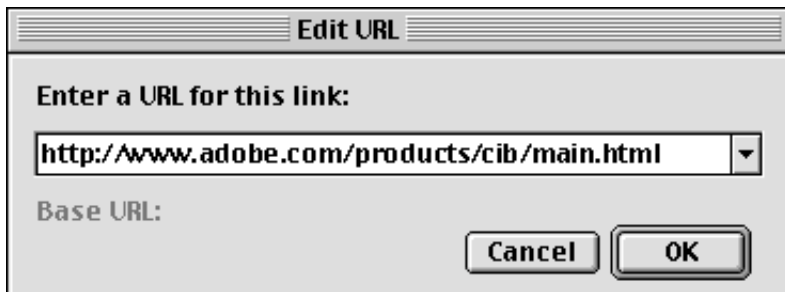

2. Set the look of your link.

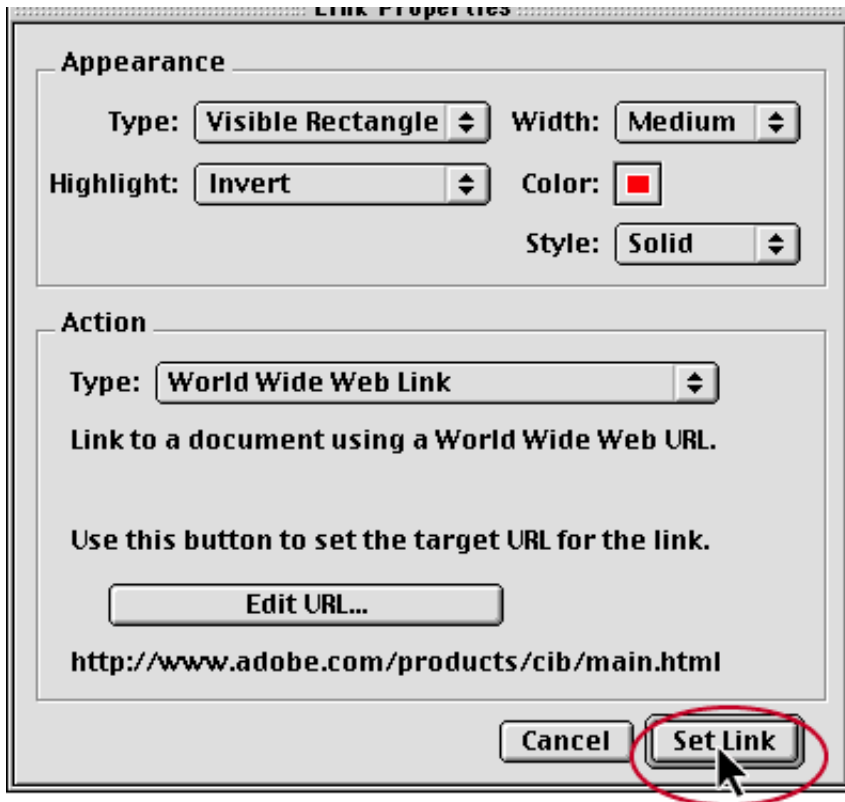

In the Appearance section of the Link Properties dialog box, specify the Type, Highlight, Width, Color, and Style of the link. The settings we chose added a solid red border of medium width around the linked element.

3. Assign a URL to the link.

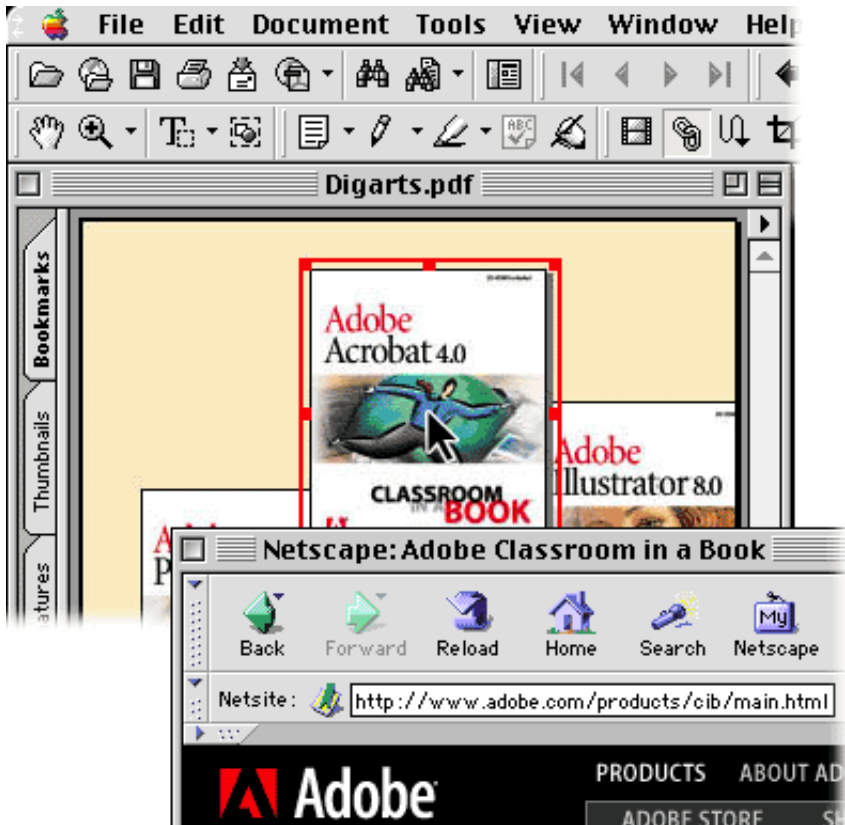

In the Action section of the dialog box, choose World Wide Web Link as the Type. Click Edit URL and enter the URL of a Web page you want the link to open. Close the Edit URL dialog box and click Set Link in the Link Properties box.

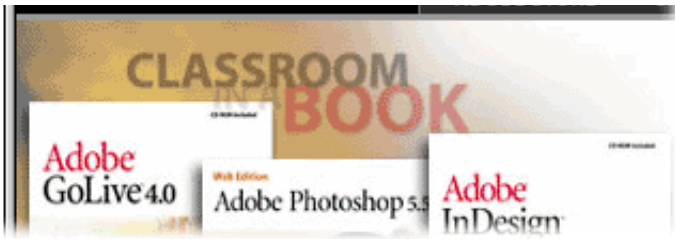

4. Test your link.

Select the hand tool and click your link. This opens the Web site you linked to in your browser. With Web links, you can carry viewers directly from your PDF page to an online store, serve up an animation, or simply provide more information on a topic.
